## Preface

Population Trends provides current demographic data for the state, counties and incorporated cities and towns.

The 1988 incorporated city and town population determinations presented in Table 2 will be used in the allocation of state revenue sharing beginning January 1989 (RCW 43.62.030). The 1988 estimates of population in unincorporated areas will be used to allocate liquor profits to counties beginning September 1988 (RCW 66.08.200) and liquor excise tax revenue beginning October 1988 (RCW 82.08.170).

### **Acknowledgements**

Special thanks are given to the following persons and agencies because of their continued help and cooperation in the publication of Population Trends: 1988: the Vital Statistics Health Data Section, Department of Social and Health Services, for supplying vital statistics data; the Office of Research and Data Analysis, Department of Social and Health Services, for providing selected institutional population counts; the Department of Veterans Affairs, for furnishing veteran institutional counts; the housing directors of the colleges and universities, for submitting April 1 dormitory counts; the Armed Forces personnel at major bases in the state for contributing data on current armed forces counts; and all of the city staff, and county and regional planners for providing data used in the development of the April 1 estimates.

The Information Services Division of the Office of Financial Management contributed both staff time and expertise in the development of the estimation software, the publication software and the production scheduling; their help has been greatly appreciated.

## **April 1, 1988 State Population Estimate**

Almost all of the state, county and municipal population figures presented in this publication are estimates. The figures are developed as accurately as possible from standard and tested techniques. The methods used to develop the state, county and city population estimates differ due to the availability of data.

On April 1, 1988, the total number of persons estimated to reside in the state of Washington was 4,565,000. This estimate is developed by a component method. Population change for persons under the age of 65 is determined by natural increase (births minus deaths) since the last census and net migration developed from school enrollment data. Medicare enrollment is used to estimate the number of persons 65 years old and over. The approximate error in the state estimate is 1 to 2 percent.

In Figure 1, the total state population, at the time of the federal census and at the time of the 1988 estimate, is detailed by age and sex. Many state programs and policies are developed for groups of persons who can be identified by their age and sex. The age by sex composition of the state's population is essential information to analysts responsible for the funding of such programs.

The population determinations recorded in Table 1 were calculated for use in the allocation of state revenues. The table also provides a record of determinations used for revenue purposes since 1980. Unless otherwise noted, the figures have not been corrected or revised subsequent to their official publication.

Three methods are used to develop estimates of persons residing in the counties. The two primary methods are the component method, described above, and the ratio-correlation method. Ratio-correlation is a regression technique that relates population change to change in one or more sets of symptomatic data. The current equation uses school enrollment, registered voters, automobile registrations and wage and salary employment. The housing unit method (discussed below for municipal estimates) is used as a supplemental technique. The average absolute error in the county estimates is between 3 and 4 percent.

Some of the 1988 population determinations are current census counts. Most, however, are estimates which represent an update of the most recent census. For instance, the 1987 figure of 19,830 for the city of Puyallup, in Pierce County, represents the city's growth since 1980, not 1986. Lynnwood, in Snohomish County, took a 1984 census. Its 1987 estimate of 24,260 is calculated from the 1984 base of 23,139.

The population estimates are generally driven by the reported change in housing stock since the census. The occupancy and population per occupied housing unit are derived from the census report. These factors are used in the calculation. However, more current information regarding the occupancy rate is often available. If it is both verifiable and reliable, it will be used. If the situation warrants, population per unit will be updated based on the trend observed since a prior census. No attempt is made to correct entries retrospectively. Comparisons between estimates made in successive years may not be valid, and may be misleading. However, with the exercise of due caution, the trend indicated by several years of estimates should be informative.

Table 2 is an important table for the analysis of population change throughout the state. The figures presented for the state and the counties have been corrected or revised where subsequent information has become available. Births and immigration contribute to population increase, while deaths and outmigration produce population decline. Births and deaths for the state and each county are recorded in the table. These data are actual counts through the end

of calendar year 1987. The data for January through March 1988 are estimated. The estimate of net migration (in minus out) is derived by subtracting the gain due to natural increase from the estimated total population change.

Table 4 reveals the differential growth of cities over the last eight years. The cities are listed in 1988 population rank order. The 1980 population and rank order are listed for comparison. A shift in the rank order often indicates a shift in social and economic resources. In most cases, where a shift has occurred, it has been slight. Several of the big jumps in the rank order can be attributed almost entirely to incorporation or annexation. Tables 7 and 8 detail the incorporation of Mill Creek and the large annexations of Wenatchee, Normandy Park, Des Moines, Mukilteo and Lacey.

Analysis of the trends presented in these first four tables is presented following Table 5, the alphabetical listing of the municipalities with 1988 population determinations.

**Notes:**

- The county and municipal populations shown for 1980 are, with a few exceptions, the 1980 federal census final counts. Jurisdictions will be advised if any further corrections are received. Federal census counts have been adjusted for annexations from January 1, 1980 to April 1, 1980.
- (\*) State Certified Special Census. A population and housing count that meets all special census certification requirements. Also indicates cities and towns with March 1, 1980 city special census count greater than the federal 1980 census count.
- (#) Informal Count. A population and housing count that is considered accurate but does not meet all special census certification requirements.
- (+) Informal Count. A population count that is considered accurate but does not meet all special census certification requirements.
- The 1981 estimates have been revised on the basis of corrections to the 1980 census counts that were provided by the Bureau of the Census in correspondence dated August 18, 1981 and February 18, 1982.  
 (\$) Indicates a correction to the 1980 census count and/or a revised 1981 estimate. With the exception of corrections to the federal census counts, annual estimates in this official series are not revised on the basis of other information that becomes available after the estimate date. As a result, population estimates shown for the individual years, from 1981 through the current estimate date, may not be comparable. Figures often vary due to data corrections or the use of new survey or census data that are not available on an annual basis. Revised county estimates are published regularly in the Components of Population Change Section in Population Trends for Washington State.
- Mill Creek incorporated in September, 1983.

TABLE 3A

**Components of Population Change for Counties  
and the State of Washington  
April 1, 1980 - 1988**

**TABLE 5-Continued**  
**Total Persons for Incorporated Cities and Towns**  
**in the State of Washington (in Alphabetical Order)**  
**April 1, 1988**

**Notes:**

1. (\*) State Certified Special Census. A population and housing count that meets all special census certification requirements.
2. (#) Informal Count. A population and housing count that is considered accurate but does not meet all special census certification requirements.
3. (+) Informal Count. A population count that is considered accurate but does not meet all special census certification requirements.

## **Population and Housing Trends Since 1980**

### **Population Change in Washington State**

Since 1980, the number of persons residing in the State of Washington has increased by nearly 433,000. This increase represents an average annual rate of growth of approximately 1.3 percent. During the 1970s, when the population increased by 719,100, the state grew, on average, at the rate of 1.9 percent per year.

The state's population has increased at a steady pace of about 20 percent each decade, based on the number of persons counted in the last three federal censuses. Yet, what appears to be a steady pace of growth from census to census is deceptive. In intervening years between each census there are both positive and negative population growth patterns that largely reflect cyclical patterns in Washington's economy.

Annual data on Washington's population provided in Table 14 reveal that the state entered the 1980s at the crest of a tremendous growth cycle (nearly 4 percent a year from 1977 to 1980). A decline in the annual rate of growth followed during the early 1980s when the population was growing at a rate of 2.3 percent per year. By April 1983, however, population growth had stalled, and the state experienced a net outmigration of nearly 16,000 persons. The state's economy increased in strength during the later part of the decade and is responsible for the slow, but steady, population growth recorded between 1985 and 1988.

Population growth and decline is accounted for by births, deaths and migration. Birth and death data are collected continuously and are assumed to be reasonably complete and accurate. The increase in Washington's population due to the surplus of births over deaths, often referred to as natural increase, tends to be slow, steady and not immediately noticed. However, more than 66 percent of the growth in population over the last eight years resulted from natural increase.

Large or sudden population change is usually the result of dramatic swings in migration. Migration is the most difficult component to estimate. At the state level, estimates of net migration (in minus out) are developed by annual tracking of school enrollment and wage and salary employment. During the last eight years the state experienced both in and out net migration. Approximately 33 percent of the increase in state residents, about 144,000 persons, can be attributed to net migration. Tables 2 and 12 provide different perspectives on the influence of both vital events and migration.

### **Geographic Distribution of Population Change**

The geographic distribution of population change varies throughout the state. A good example of this is found in the uneven growth patterns among the counties detailed in Table 2. Most of the increase in state population, about 393,700 of the 433,000 total, occurred in nine of the largest counties. Six of these, King, Kitsap, Pierce, Snohomish, Thurston, and Whatcom, which together increased by about 345,000 people, border on Puget Sound. The three other counties, with gains of over 10,000 persons each, are Clark, in the southwestern, Spokane, in the eastern, and Yakima, in the south central parts of the state. Five counties, two west of the Cascades, and three east of the mountains, lost a total of about 9,700 people. The rest of the counties have had small to moderate gains, due in most part to natural increase.

The rate of population growth reflects some of the challenges faced by local governments and organizations as their population grows or declines. The rate relates the pace of population growth to the size of the population at the time of the census. San Juan County has recorded the highest average annual rate of growth, 2.81 percent, over the eight-year period. The growth

of San Juan County is mostly the result of migration rather than natural increase. Island, Thurston, Snohomish and Mason Counties have also had very high growth rates. It should be noted that an increase in correctional institution population accounted for 22 percent of Mason County's growth over the 1980 to 1984 period. Migration proves to have more influence on population change at the county level than at the state level. Twenty-two of the 39 counties have had a greater number of outmigrants than immigrants since 1980 (Table 3).

Another way to assess the impact of population changes on a county is by studying the components of population change (births, deaths, and migration) in detail. In the state as a whole there were roughly twice as many births as there were deaths. Some counties experienced nearly equal numbers of births and deaths while other counties had over three times as many births compared to deaths.

Benton and Franklin Counties each had over three times as many births than deaths between 1980 and 1988, resulting in both their populations having substantial amounts of natural increase. However, Benton County experienced a large overall population decline because of significant amounts of out migration even though its natural increase was very high. Franklin County, while holding roughly constant in size between 1980 and 1988, experienced significant outmigration as well, but its outmigration was offset by its exceptionally high degree of natural increase. As a result, Benton County would have had a substantially greater population decline than it did, and Franklin County would have lost population rather than gained, were it not for their high number of births relative to deaths.

King County experienced steady and substantial population growth between 1980 and 1988, adding over 140,000 people to its 1980 population by 1988. King County, however, experienced below average natural increase between 1980 and 1988. It had less than twice as many births than deaths. As a result, an inordinately large share of its population growth came from migration.

Similar detailed examinations of the relationship between natural increase and migration, in combination with the history of population growth and decline provided in Table 2, can be carried out for each county. Examinations of this type yield important information on the character and timing of population change for the county or counties of interest.

### **Populations in Cities and Towns**

The population of Washington State resides in either incorporated cities and towns or in unincorporated portions of a county. Table 1 reveals that in 1980 more than 51 percent of the state population lived in incorporated municipalities. By 1988, the incorporated cities and towns accounted for only about 49 percent of the population. State incorporated population growth has averaged about a half of a percent per year since 1980. Counties east of the Cascades are characterized by large portions of their populations in incorporated cities and towns. Counties in western Washington generally have more sizable populations in unincorporated areas. The ten fastest growing counties in the state, all on the western side of the Cascades, credit most of their population growth to their unincorporated areas.

Population change in the 11 central cities in Washington's large metropolitan counties accounted for an increase of about 2,700 persons, 0.2 percent, between 1980 and 1987. This growth is a smaller increase than occurred between 1970 and 1980, a time when these cities gained 15,400 people. The unincorporated parts of the 11 large metropolitan counties increased cumulatively by about 234,100 people between 1980 and 1987. While not all of the unincorporated portions of these counties are in urbanized areas, at least 60 percent are included. The trend to move out of urbanized areas and into suburban areas is similar to the population redistribution occurring in other states.

Table 4 provides a ranking of the cities by the size of their population in 1988. Comparison of the 1988 rank with the 1980 rank suggests a redistribution of social and economic resources. Growth and decline of city populations is evident in increases and decreases in the proportion of the state's population living in each city. Some cities increased their share of the state's population while others have lost share.

The fifteen largest gains in share of the state's population were made in smaller cities in the Puget Sound Basin. All of these communities are within commuting distance of the central cities associated with their metropolitan areas. Kirkland, the leading share gainer, increased its share from less than 1 percent of the state's population to over 1.5 percent of the population between 1980 and 1988. Other smaller cities and towns in King and Snohomish Counties are gaining share quickly as well. The only leading share gainers outside of King and Snohomish Counties are Lacey in Thurston County and Puyallup in Pierce County.

While many of the smaller communities around major metropolitan cities are increasing their share of the state's population the major metropolitan cities are losing share. Tacoma, Spokane, and Seattle all decreased in share between 1980 and 1988. In addition, smaller communities outside of the Puget Sound Basin are also losing share.

Cities and towns increase their size because people come in, or their boundaries may expand to include more people. Within the last seven years, municipalities have annexed slightly more than 104 square miles, increasing the total area within corporate limits by a little more than ten percent. At the various times of annexation, 28,800 people lived in these annexed areas. The number of people in these areas today is undoubtedly different from this number. The people living in the annexed parcels are no more inclined to stay in place than is anyone else. Furthermore, housing is more likely to be built or demolished in annexed parcels than anywhere else. More rarely, a city or town may give up a parcel of land through deannexation, which may or may not have any residents, to the county. Tables 7 and 8 list the boundary changes made by cities and towns since 1980.

The incorporation of a city or town is about as rare an event as a deannexation. Mill Creek, in Snohomish County, incorporated on September 30, 1983 and is the latest to do so. There is no trend for this city prior to its appearance, with about 3,355 residents, in 1983. The next most recent incorporation was Ocean Shores, in Grays Harbor County, in November, 1970.

An even rarer event is disincorporation. The last city to disincorporate was Elberton, in Whitman County, in 1966. Similar to a disincorporation is the merging of one city or town with another. In the early 1970s, Mercer Island Town merged with Mercer Island City, in King County, and Westlake merged with Moses Lake, in Grant County. There have been recent incorporation attempts in Federal Way and Woodinville, both in King County, but they have failed. Such movements, if successful, may alter the relationship between populations living in incorporated and in unincorporated areas.

### **The Measurement of Change**

Each year the population unit of the Office of Financial Management is required to produce a population determination for each of the 266 incorporated cities and towns and the 39 counties. The tremendous turnover in population throughout the state underscores the care that must be put into each estimate.

The cities in Washington are all part of a dynamic system that responds to changes in social and economic conditions. All cities and towns change from year to year. Table 4 reveals the amount of change that the system can experience in even a relatively short time as an eight

year period. Even in small cities and towns the size and composition of the population is constantly changing due to vital events, occupational mobility, and geographical mobility.

A special study on the mobility of the state's population, produced from the 1980 census, dispels the widely held impression that most communities are stable and unchanging. The study found that the state lost 358,000 outmigrants while gaining 743,000 new residents during the five-year period preceding the census. Nearly 407,000 persons relocated to another county within the state. In addition, the census recorded about 1,111,000 individuals who moved to another house in the same county. Only 45 percent of the population was found to reside in the same house for five or more years.

Some population change is temporary. Major construction projects take place over several years. The projects at Hanford, Satsop, and in the Grand Coulee area attracted people to places where they had not been before. The largest numbers of these immigrants, in the early stages, were construction workers, who moved on when the phase of the job they were doing was finished. Usually they were replaced by other workers involved in later phases of the project. Finally, construction workers are usually replaced by a small operations staff. The result was a localized boom town population increase, followed by a decrease to a level only slightly different than existed before all the activity began.

The housing unit method is used to prepare municipal population estimates. The method builds on local area censuses. A federal census or a special census taken by a county, city or town reveals more than a glimpse of the area at the time. It provides the benchmark count of total persons in housing units and in group quarters. In addition, it allows a calculation of occupancy rates and average household sizes. When related to earlier counts, the census is used to chart new trends.

The underlying assumption of the housing unit method is that people usually live in homes, be they detached houses or apartments in a large building. Individuals may live part of the time in different homes, but usually they live at one residence for the majority of the year. These homes are the usual places where the individuals sleep. They have either cooking facilities or a separate entrance, or both, and are technically called housing units. In 1980, about four million people in Washington lived in about one and one-half million housing units of one type or another (Table 6). At the same time, nearly 109,000 more people lived in group quarters. These people were in college dormitories or social houses, military barracks, retirement facilities, long term convalescent centers, mental or penal institutions, or some other type of group living arrangement. In a very few instances, some lived on the streets, sleeping under bridges or in some other substitute shelter (Table 6).

Generally, the number of housing units within the boundaries of counties, cities, and towns increases over time. More new units are built than old units demolished. This increase in units may result in an increase in population. Table 8 shows that large increases in population usually coincide with large increases in housing. But new units do not automatically mean new people, or more people. Many cities reported a large number of newly completed housing units during the last year. Survey data, gathered at about the date of the estimates, indicate that many of the new apartment buildings are filling up slowly. Thus, occupancy rates used to estimate population in new units are typically lower than those for older housing.

Since 1980, the number of households has grown at an average annual rate of 1.8 percent while the population has grown at a rate of 1.2 percent. The faster growth of households in comparison with the much slower growth of population is partly due to the long-running trend of decreases in household size. In Washington State in 1960 the number of persons per household was 3.09. By 1970 the number was 2.93 and the 1980 census recorded a number of 2.61. The

number of persons per household in Washington has continued to fall as seen in the 1987 estimate of 2.50 persons per household. The decline in household size has not been as pronounced in all regions of the state. It has also shown differences according to the type of structure.

The decrease in household size is the result of several social changes. The most evident is fewer children in families. Thirty years ago, most mothers were having three or four children, today one or two is the norm. Divorces, separations, and abandonments have also led to smaller households. In addition, men and women now marry later. These events often lead to a rise in occupancy rates. Yet, it appears that more housing units are being occupied by the same or a smaller number of people.

The normal progression of the family life cycle is also responsible for the decline in the average number of persons per occupied household. When the youngsters are out of high school, they often leave the family home to go out on their own, off to college, or into the military. In many cases, these young adults cannot afford to locate in the same community as their parents. Housing may be too expensive, transportation too arduous or the economy may not be able to absorb them.

The increase in life expectancy is another contributing factor to the decline in household size. Widows and widowers are frequently living on their own. Many cities are reporting the completion of new units built specifically for the elderly. Data indicate that these units predominantly tend to have only one occupant each. Again, occupancy may be greater, but the population may fall, since the average household size is small.

Changes in population size and characteristics are of significant interest to policy makers at both the state and local level. Efforts to learn more about both the characteristics and size of local populations are underway. These efforts are fueled by new information and data being gathered. Data from the 1990 census will help in efforts to examine and better understand both the size and characteristics of Washington's population. In addition, in preparation for the 1990 census the Bureau of the Census conducted a test census in 1988 of much of eastern Washington. Further demographic studies will be conducted as these data become available.

Notes:

1. The county and municipal housing units shown for 1980 are, with a few exceptions, the 1980 federal census final counts. Federal census counts have been adjusted for annexations from January 1, 1980 to April 1, 1980.
2. Mill Creek incorporated in September 1983.
3. (\*) The mobile home and trailer data for most unincorporated areas exclude changes in mobile home parks for all or part of the 1980-88 reporting period. Mobile home and trailer losses tend to be underreported. The number of mobile homes and trailers in areas that have experienced a large outmigration (such as Benton and Grays Harbor counties) tend to be overestimated.
4. Housing unit estimates are revised on an annual basis to include the most current data available.
5. In a few cases, the 1980 federal census data have been proven to be in error by subsequent censuses (e.g., Gold Bar, La Center and Palouse).
6. In the 1980 federal census, 15 to 20 percent of the mobile homes and house trailers in Washington were classified as single family houses. A negative figure in the mobile home/trailer category indicates a city has lost more mobile homes/trailers than were counted in the 1980 census. When using the housing data, negative numbers should be subtracted from single family housing.

## **Annexations, Incorporations, and Municipal Boundary Changes**

The Office of Financial Management (OFM) is directed to certify the total number of persons and housing units in annexed areas. Municipalities must conduct a census of all population and housing in annexed areas. Annexation censuses provide accurate counts of population and housing, occupancy, and average household size. While OFM certifies the annexation census it does not certify that the annexation is free from error or that it is legal.

The annexation census data are used in producing OFM's annual April 1 population estimates. In addition, municipal population estimates are updated quarterly to include all populations annexed from the base year estimate to the current date. State revenue allocations to municipalities are made on the basis of these adjusted population estimates.

The certified figures are required by many state and federal agencies. Geographers at the Bureau of the Census and the state's Department of Transportation use the certified data to update municipal boundary maps.

Since 1980, the total incorporated area of the state has increased by 118 square miles. More than 75 percent of the 266 incorporated cities and towns in the state have made boundary changes. These municipalities have annexed 1,094 parcels of land. The parcels included 23,343 housing units which were homes for 54,677 people. The current incorporated land area is now slightly greater than 1,115 square miles. This amounts to 1.67 percent of the total land area in the state.

Between 1980 and 1988, one city, Mill Creek in Snohomish County, has incorporated. Two cities, Roy in Pierce County and Port Orchard in Kitsap County, have repealed approved annexations.

Five cities annexed over 2,000 persons since 1980: Kirkland, 16,476; Des Moines, 5,014; Kennewick, 3,655; Bellevue, 2,909; and Mukilteo, 2,834.

In some cases all of the population growth can be credited to annexed areas. Wenatchee, in Chelan County, and Normandy Park, in King County, recorded increases in residents that equaled the number of persons annexed; the population within the original city limits remained relatively stable.

In Snohomish County, Mukilteo's population tripled when it annexed 2,834 people in one annexation. Population and housing growth in the annexed area has contributed to the further population growth of 1,400 since the annexation. Des Moines, in King County, and Lacey, in Thurston County, show population growth in the old city limits; only 44 to 74 percent of their growth is the result of annexations.

Some cities, in economically depressed areas, continue to show overall population declines in spite of fairly large annexed populations. Kennewick, in Benton County, has annexed 3,655 people. At the same time the total population has only increased by 2,783, an indication that the city has actually been losing population over time.

More than 50 percent of the total 1980 to 1988 population growth for 27 cities was the result of annexations. For 26 cities, population annexed during the eight year period totaled more than 5 percent of their April 1, 1980 population.

**Notes:**

\* Includes annexations, incorporations, and other municipal boundary changes. Annexed areas of less than .001 square miles are shown as 0.000 square miles.

\*\* Land area for 1980 was primarily supplied by municipal officials.

## Growth of Households

The number of households reported in Table 9 for 1970 and 1980 are census counts of the number of occupied housing units. The 1988 estimate is based on data reported by the counties and the municipalities. The occupancy rates used to produce the estimates were derived from the 1980 federal census and subsequent special censuses and surveys.

During the 1970s, households grew at an annual rate of 4.6 percent. This rate is more than two and one-half times greater than the current rate. In the ten-year period prior to 1980, the state recorded a net gain of 417,185 households. Since 1980, the net gain is slightly over 247,000 households, an average annual gain approximating 2.0 percent.

The growth in households has become more geographically concentrated in the 1980s. King County and Snohomish County alone account for 50 percent of the net increase. Benton, Cowlitz, and Grays Harbor Counties together account for more than 7 percent of the net growth in the 1970s. Over the last eight years, they can only claim about 1 percent.

The many social and economic factors that have contributed to the long-term decline in the number of persons per household are somewhat responsible for the faster growth rate of households relative to the growth rate of the population. The average household growth rate of 2.0 percent is matched to the average population growth rate of 1.3 percent since 1980. During this period, the number of persons per household fell from 2.61 to 2.49. During the 1970s, when persons per household fell from 2.93 to 2.61, the growth rate of households equaled 4.6 percent while the growth of population was 1.9 percent.

In those counties with the fastest rates of growth since 1980, the rate of household growth only slightly exceeded the population growth rate. In the slow growth counties, the rate of net gain in households exceeded the population growth rate by three or more times. Whatcom County is the only county where the rate of population growth exceeded the rate of household growth.

Observation of the varying rates of growth can produce an awareness of the speed at which change is occurring. Speed gives a sense of urgency; however, the demand for resources comes from the amount of change. In 21 counties, the net gain in the number of persons was greater than the net gain in households. These 21 counties were predominantly the large, highly urbanized counties in western Washington. The 18 counties where the gain in households exceeded the gain in population tended to be heavily dependent on extractive industries. The highest levels of net outmigration were usually found in those counties where the gain in population far exceeded the gain in households.

TABLE 9

**Growth of Households for Counties  
and the State of Washington  
April 1, 1970, 1980, and 1988**

|                    | Households |           |           | Percent Share of Total |          |          | Average Annual     |                   |

## The Population 65 Years Old and Over

Fed by a steady increase in births prior to 1920, persons age 65 and older continue to be one of the fastest growing segments of the population. This elder population constituted 9.9 percent of the total U.S. population in 1970, 11.3 percent in 1980, and 12.2 percent in 1987, the last year for which national data are available.

Compared to the nation, persons 65 and older are a smaller proportion of the Washington State population, but their numbers are growing faster. Elders comprised 9.5 percent of the state's population in 1970, 10.4 percent in 1980, and 11.8 percent in 1987. In 1988, they are an estimated 11.9 percent of the state total. However, because the total state population grew faster than the nation's, this comparison understates the more rapid increase in the absolute number of elders residing in the state.

Between 1980 and 1987, the national elder population expanded at an average annual rate of 2.4 percent. Meanwhile, the state's grew 3.2 percent a year, from 431,562 in 1980 to an estimated 543,612 in 1988, and Washington moved from 33rd to 31st among states in the percentage of population 65 or older. By comparison, since 1980 the total state population has increased an average of 1.3 percent a year.

The elder population is not only growing in size, it is also aging. Between 1980 and 1988, the number of Washington residents age 65 to 74 rose 21 percent. However, the rate of increase among persons 75 and older was even higher: 32 percent for those between the ages of 75 and 84, and 33 percent among those 85 and older. In 1980, the young old (age 65 to 74) comprised 61 percent of Washington's elders and the old old (85 and older) numbered 9.6 percent. In 1988, the old old are an estimated 10.2 percent of the state's elders, and the proportion of young old has fallen to 59 percent. It will continue to drop until the year 2002, when the young old will number only half of all elders. Then, as the leading edge of the baby boom turns 65, the ranks of the young old will start to swell. See Figure 3.

The growing number of elders and their changing age distribution have important consequences for Washington citizens. Elders are not a homogeneous group. The young old enjoy unprecedented levels of good health and adequate income. However, among the old old, advancing age is accompanied by increased risk of chronic illness, disability, and poverty. As more people reach advanced old age, more personal, family, and government resources are required to provide for their long term health care. Nursing home utilization, as one indicator of serious disability and health care need illustrates the point. In 1980, one quarter of all Washington residents 85 and older were living in nursing homes, compared to 1.7 percent of the young old.

Table 10 provides federal census counts and estimates of the population 65 years and older for the counties and the state. The estimates are developed from changes, by county, in Medicare enrollments which include most elders.

Considerable variation exists across counties in the proportion of residents 65 and older, and growth rates among this segment of the population. Whitman County, with its large population of college students, has the lowest estimated percentage of elder residents (9.1 percent). Next is fast-growing Snohomish county (9.8 percent). Although this county's elder population has increased by an estimated 36.3 percent since 1980, rapid growth in the number of younger residents has kept its proportion of elders below the state average.

In five counties, elders comprise around 20 percent of the population. Garfield County, with 22.0 percent, has the highest concentration of elders in the state, due not to population growth, but

to loss. The number of elders has increased at about the state average, but the county has experienced a population decline in younger age groups.

The other four counties with the highest proportion of elders are on the coast: Pacific, Clallam, Jefferson, and San Juan. Pacific County has had lower than average growth in the elder population, but expansion among other segments of the population has also been relatively small. In the other three counties, the elderly population has increased around 40 percent over the last eight years, outstripping growth of the under 65 population.

Three additional counties, Thurston, Mason, and Island, have experienced over 40 percent growth in their elder populations since 1980. However, substantial increases among younger age groups have kept elder representation in these counties to between 11.5 and 15.4 percent of the total.

Note: This series of estimates corrects for the coverage errors in the 1970 census, and will not match previously published estimates of the population age 65 years and over. A state level adjustment factor was used to correct 1970 census county population as more detailed correction factors were not available. The state correction factor was developed from series SOR 31-WCF-1 BACF-1 described in Demographic Estimates of the Coverage of the Population of States in the 1970 Census: Demographic Analysis, Current Population Reports, series P-23, No. 65, released by the Bureau of the Census in a memorandum to Federal State Cooperative Program members, April 6, 1983.

Note: This series of estimates corrects for the coverage errors in the 1970 census, and will not match previously published estimates of the population aged 65 years and over. A state level adjustment factor was used to correct 1970 census county population as more detailed correction factors were not available. The state correction factor was developed from series SOR 31-WCF-1 BACF-1 described in Demographic Estimates of the Coverage of the Population of States in the 1970 Census: Demographic Analysis, Current Population Reports, series P-23, No. 65, released by the Bureau of the Census in a memorandum to Federal State Cooperative Program members, April 6, 1983.

## **1988 Population Estimates by Bureau of the Census Racial Categories and the Spanish Origin Population**

The Office of Financial Management (OFM) is responsible for population estimates and forecasts. Since the early 1970's, OFM has published estimates by race and Spanish Origin. Based upon questions raised about the estimates, OFM recently reviewed the estimate methodology.

### **Methodology**

Component Method II had previously been used to estimate population by race and Spanish Origin. Component Method II adds births, subtracts deaths, and adds an estimate of net migration to the base population (i.e. the population counted in the 1980 census). Typically, net migrants are estimated from school children enrollment data collected by the Superintendent of Public Instruction (SPI). The birth and death data are collected by the Vital Records Unit of the Department of Social and Health Services (DSHS).

A difference in race definitions between Vital Records and the Census Bureau was identified as a source of error in the previous methodology. Some Hispanic designations recognized by the Census Bureau are not included in the Spanish Origin classification that Vital Records maintains for the National Center for Health Statistics. OFM and DSHS are working on a process to code birth and death data so that it is consistent with the Census Bureau's definitions. Beginning in 1988, all Hispanic ethnic groups will be classified as Hispanic.

Although Vital Records collects data on race, data were not collected on respondents Spanish Origin status. In the 1980 Census, respondents were asked in a separate question whether they were of Spanish Origin or descent. Spanish Origin is not a racial category, and persons of Spanish Origin may be of any race. A separate question on Spanish Origin has been added to the 1988 birth and death certificates.

Because consistent data will not be available until 1989, a 20 percent sample of 1986 birth certificates were recoded into Bureau of the Census racial categories. The results were used to adjust vital statistics data into categories consistent with the Census Bureau's. The current methodology uses these adjusted categories to estimate births and deaths by race.

A review of school enrollment data also revealed a difference in racial definitions used between SPI and the Census Bureau. Because of the difference, the revised methodology uses Census Bureau trends to estimate net migration rates by race. The estimates of net migration by race were controlled to the estimated total net migration for Washington.

County estimates were generated using the county ratio of the state total. County numbers were controlled to both the county total population counts and to the state totals by race and Spanish Origin.

The previous estimates for 1981 through 1986 have been revised according to the methodology described above. These revised estimates appear in Table 11.

### **Highlights**

The revised 1988 population estimates list the Spanish Origin population as the largest ancestry minority group in the state, and the Asian and Pacific Islander population as the largest racial minority group in the state.

The state total population grew from 4,132,156 to 4,565,000 -- 10.5 percent between 1980 and 1988 (Table 3A). The white population increased at a slower rate, from 3,779,170 to 4,083,002 -- 8 per-

cent between 1980 and 1988 (first row and second column on 1980 Table 11 and 1988 Table 11). Growth rates for the Black, the American Indian, the Asian and Pacific Islander, and the Other population increased at a faster pace.

The Spanish Origin population (based on ancestry) increased from 120,016 to 166,486 (+ 46,470) between 1980 and 1988, (first row and last column of 1980 Table 11 and 1988 Table 11). For comparative purposes, the 1980 census shows that 32,941 persons of Spanish Origin migrated to Washington between 1975 and 1980.

The racial composition of Washington State is changing over time due to the faster growth rates of the racial minority groups. In 1980, racial minorities comprised 8.5 percent of the total population. By 1988, racial minorities were estimated to comprise 10.6 percent of Washington's total population.

The Spanish Origin composition of Washington is also changing over time due to the faster growth rate of the Spanish Origin population compared to the non-Spanish Origin population. In 1980, the Spanish Origin population comprised 2.9 percent of the total population. By 1988, the Spanish Origin population is estimated to comprise 4 percent of Washington's total population.

The Immigration Reform Control Act of 1986 set forth a process by which undocumented aliens could become legal residents. The opportunity to apply was first offered in May, 1987. At the time of application, applicants are issued work authorization cards. A decision on temporary legal residency status is made when the application is reviewed. At a later date, the temporary legal residency status may become permanent. The final application period will close in November of 1988. It is anticipated that decisions will have been reached regarding the temporary legal residency status of all applicants over the next year.

1. The Other racial category is a count of persons who marked Other Race on the 1980 census questionnaire and wrote in entries such as Cuban, Puerto Rican, Mexican, etc. They represent persons who when given an opportunity to identify themselves in a racial category did not select White (or any other category), but specifically identified themselves as Cuban, Puerto Rican, Mexican, etc. In 1980, this category represented a count of 67,154 persons who considered themselves racially Spanish and 9,402 additional responses that could not be elsewhere classified.
2. Spanish Origin is not a racial category: it may be viewed as an ancestry group. Persons of Spanish Origin may be of any race and are counted in the racial categories shown. In 1980, 44.4% of persons indicating Spanish Origin identified themselves as being racially White, 1.3% Black, 2.3% Indian, 4.4% Asian, and 47.6% selected the Other races category.

NOTE: Estimates for racial and Spanish Origin categories are variable because of the small numbers involved. Caution is advised in interpreting 1980-81 change for categories of less than 500 persons.

1. The Other racial category is a count of persons who marked Other Race on the 1980 census questionnaire and wrote in entries such as Cuban, Puerto Rican, Mexican, etc. They represent persons who when given an opportunity to identify themselves in a racial category did not select White (or any other category), but specifically identified themselves as Cuban, Puerto Rican, Mexican, etc. In 1980, this category represented a count of 67,154 persons who considered themselves racially Spanish and 9,402 additional responses that could not be elsewhere classified.
2. Spanish Origin is not a racial category: It may be viewed as an ancestry group. Persons of Spanish Origin may be of any race and are counted in the racial categories shown. In 1980, 44.4% of persons indicating Spanish Origin identified themselves as being racially White, 1.3% Black, 2.3% Indian, 4.4% Asian, and 47.6% selected the Other races category.
3. 1981 estimates of the Spanish Origin population were developed from the 1981 population estimates by race. The 1980 ratio of Spanish Origin persons in each racial category was applied to the 1981 estimates by race to derive an estimate of the total Spanish Origin Population.

NOTE: Estimates for racial and Spanish Origin categories are variable because of the small numbers involved. Caution is advised in interpreting 1980-83 change for categories of less than 500 persons.

1. The Other racial category is a count of persons who marked Other Race on the 1980 census questionnaire and wrote in entries such as Cuban, Puerto Rican, Mexican, etc. They represent persons who when given an opportunity to identify themselves in a racial category did not select White (or any other category), but specifically identified themselves as Cuban, Puerto Rican, Mexican, etc. In 1980, this category represented a count of 67,154 persons who considered themselves racially Spanish and 9,402 additional responses that could not be elsewhere classified.
2. Spanish Origin is not a racial category; it may be viewed as an ancestry group. Persons of Spanish Origin may be of any race and are counted in the racial categories shown. In 1980, 44.4% of persons indicating Spanish Origin identified themselves as being racially White, 1.3% Black, 2.3% Indian, 4.4% Asian, and 47.6% selected the Other races category.
3. 1983 estimates of the Spanish Origin population were developed from the 1983 population estimates by race. The 1980 ratio of Spanish Origin persons in each racial category was applied to the 1983 estimates by race to derive an estimate of the total Spanish Origin Population.

NOTE: Estimates for racial and Spanish Origin categories are variable because of the small numbers involved. Caution is advised in interpreting 1980-84 change for categories of less than 500 persons.

1. The Other racial category is a count of persons who marked Other Race on the 1980 census questionnaire and wrote in entries such as Cuban, Puerto Rican, Mexican, etc. They represent persons who when given an opportunity to identify themselves in a racial category did not select White (or any other category), but specifically identified themselves as Cuban, Puerto Rican, Mexican, etc. In 1980, this category represented a count of 67,154 persons who considered themselves racially Spanish and 9,402 additional responses that could not be elsewhere classified.
2. Spanish Origin is not a racial category; it may be viewed as an ancestry group. Persons of Spanish Origin may be of any race and are counted in the racial categories shown. In 1980, 44.4% of persons indicating Spanish Origin identified themselves as being racially White, 1.3% Black, 2.3% Indian, 4.4% Asian, and 47.6% selected the Other races category.
3. 1984 estimates of the Spanish Origin population were developed from the 1984 population estimates by race. The 1980 ratio of Spanish Origin persons in each racial category was applied to the 1984 estimates by race to derive an estimate of the total Spanish Origin Population.

NOTE: Estimates for racial and Spanish Origin categories are variable because of the small numbers involved. Caution is advised in interpreting 1980-85 change for categories of less than 500 persons.

1. The Other racial category is a count of persons who marked Other Race on the 1980 census questionnaire and wrote in entries such as Cuban, Puerto Rican, Mexican, etc. They represent persons who when given an opportunity to identify themselves in a racial category did not select White (or any other category), but specifically identified themselves as Cuban, Puerto Rican, Mexican, etc. In 1980, this category represented a count of 67,154 persons who considered themselves racially Spanish and 9,402 additional responses that could not be elsewhere classified.
2. Spanish Origin is not a racial category; it may be viewed as an ancestry group. Persons of Spanish Origin may be of any race and are counted in the racial categories shown. In 1980, 44.4% of persons indicating Spanish Origin identified themselves as being racially White, 1.3% Black, 2.3% Indian, 4.4% Asian, and 47.6% selected the Other races category.
3. 1985 estimates of the Spanish Origin population were developed from the 1985 population estimates by race. The 1980 ratio of Spanish Origin persons in each racial category was applied to the 1985 estimates by race to derive an estimate of the total Spanish Origin Population.

NOTE: Estimates for racial and Spanish Origin categories are variable because of the small numbers involved. Caution is advised in interpreting 1980-86 change for categories of less than 500 persons.

1. The Other racial category is a count of persons who marked Other Race on the 1980 census questionnaire and wrote in entries such as Cuban, Puerto Rican, Mexican, etc. They represent persons who when given an opportunity to identify themselves in a racial category did not select White (or any other category), but specifically identified themselves as Cuban, Puerto Rican, Mexican, etc. In 1980, this category represented a count of 67,154 persons who considered themselves racially Spanish and 9,402 additional responses that could not be elsewhere classified.
2. Spanish Origin is not a racial category; it may be viewed as an ancestry group. Persons of Spanish Origin may be of any race and are counted in the racial categories shown. In 1980, 44.4% of persons indicating Spanish Origin identified themselves as being racially White, 1.3% Black, 2.3% Indian, 4.4% Asian, and 47.6% selected the Other races category.
3. 1986 estimates of the Spanish Origin population were developed from the 1986 population estimates by race. The 1980 ratio of Spanish Origin persons in each racial category was applied to the 1986 estimates by race to derive an estimate of the total Spanish Origin Population.

NOTE: Estimates for racial and Spanish Origin categories are variable because of the small numbers involved. Caution is advised in interpreting 1980-87 change for categories of less than 500 persons.

1. The Other racial category is a count of persons who marked Other Race on the 1980 census questionnaire and wrote in entries such as Cuban, Puerto Rican, Mexican, etc. They represent persons who when given an opportunity to identify themselves in a racial category did not select White (or any other category), but specifically identified themselves as Cuban, Puerto Rican, Mexican, etc. In 1980, this category represented a count of 67,154 persons who considered themselves racially Spanish and 9,402 additional responses that could not be elsewhere classified.
2. Spanish Origin is not a racial category; it may be viewed as an ancestry group. Persons of Spanish Origin may be of any race and are counted in the racial categories shown. In 1980, 44.4% of persons indicating Spanish Origin identified themselves as being racially White, 1.3% Black, 2.3% Indian, 4.4% Asian, and 47.6% selected the Other races category.
3. 1987 estimates of the Spanish Origin population were developed from the 1987 population estimates by race. The 1980 ratio of Spanish Origin persons in each racial category was applied to the 1987 estimates by race to derive an estimate of the total Spanish Origin Population.

NOTE: Estimates for racial and Spanish Origin categories are variable because of the small numbers involved. Caution is advised in interpreting 1980-88 change for categories of less than 500 persons.

1. The Other racial category is a count of persons who marked Other Race on the 1980 census questionnaire and wrote in entries such as Cuban, Puerto Rican, Mexican, etc. They represent persons who when given an opportunity to identify themselves in a racial category did not select White (or any other category), but specifically identified themselves as Cuban, Puerto Rican, Mexican, etc. In 1980, this category represented a count of 67,154 persons who considered themselves racially Spanish and 9,402 additional responses that could not be elsewhere classified.
2. Spanish Origin is not a racial category; it may be viewed as an ancestry group. Persons of Spanish Origin may be of any race and are counted in the racial categories shown. In 1980, 44.4% of persons indicating Spanish Origin identified themselves as being racially White, 1.3% Black, 2.3% Indian, 4.4% Asian, and 47.6% selected the Other races category.
3. 1988 estimates of the Spanish Origin population were developed from the 1988 population estimates by race. The 1980 ratio of Spanish Origin persons in each racial category was applied to the 1988 estimates by race to derive an estimate of the total Spanish Origin Population.

## **Selected Resident Institutional Population**

The 1988 populations shown for Washington's counties and incorporated cities and towns in Table 1 include approximately 114,000 persons living in group quarters facilities. Of this total, 10,948 reside in state and federal correctional institutions, long term care facilities for the mentally or physically disabled and veteran homes. Counts of the resident population in institutions that are under state or federal jurisdictions are relatively easy to obtain and often identify a major source of population change for local governments.

The 1988 population of Buckley, in Pierce County, includes 561 residents at Rainier School. The school's population represents 18 percent of Buckley's 3,040 city residents. A decline of 217 residents at Rainier School since 1980 has contributed to a decline in Buckley's population.

The institutional figures shown for Mason county in Table 12 represent a count of the resident inmates at the Washington Corrections Center at Shelton and the Mission Creek Youth Camp. The inmate population at the Corrections Center remained relatively stable from 1970 to 1979, ranging from about 600 to 700 residents. Due to an expansion of the facility, the inmate population increased from 776 in 1980 to 1,584 by 1984. This increase accounted for 22 percent of Mason County's population growth over the 1980 to 1984 period.

The 1988 institutional population of 1,226 shown for Spokane County in Table 12 includes 245 persons in correctional facilities in the unincorporated area and 881 persons in three long-term care facilities located within the corporate limits of Medical Lake. Patients at Eastern State Hospital and persons with developmental disabilities living at Interlake School and Lakeland Village represent 23 percent of Medical Lake's total 3,760 residents. The institutional population in these three facilities represented over 50 percent of Medical Lake's population at the start of the 1970s, but declined by over 1,000 through the decade.

The selected institutional populations shown in Table 12 represent approximately ten percent of the state's total group quarters population. Other group quarters populations that are a source of local area population change include homes for the aged, college dormitory populations, and military personnel living in barracks and on ships.

## Resident Armed Forces Personnel

The 1988 estimate of resident armed forces personnel for the state of Washington is 63,865. Most of the fluctuations in the estimates are due to changes in the number of ships being overhauled at the Puget Sound Naval Shipyard in Bremerton. The shipboard personnel count at the shipyard was 1,730 in 1980, over 4,000 in both 1981 and 1985 and only 372 in 1987. The count increased to 3,463 in 1988 due to the arrival of the Nimitz. Due to increases in more permanent military personnel since 1980, the state's armed forces total does not drop below 59,000, even when the counts of shipboard population at Bremerton are minimal.

Table 13 provides federal census counts and estimates of the resident armed forces population by county. Resident armed forces personnel are included in the resident population counts and estimates for the state, counties and local governments. These annual estimates provide a basis for determining civilian labor force figures, civilian population movement and other information for the civilian population that is lumped together with large military populations.

The importance of the military population in the state can be derived from data collected in the early 1970s. Washington recorded a net outmigration of 28,700 persons between 1971 and 1972. Figure 2 shows that the level of outmigration was high enough to cause the state's population to decline. The decline is usually attributed to the sharp reduction in aerospace employment at Boeing. Actually, a troop reduction of over 15,000 at Fort Lewis accounted for over one-half of the state's net outmigration during this period. It took more than a decade for the number of armed forces personnel to again reach 1970 and 1971 levels.

Changes in the armed forces population often cause noticeable changes in local area populations. This is particularly true for naval port cities that are subject to large differences in shipboard populations. The sharp variation in the population estimates for Bremerton and Kitsap County in Table 1, and in the armed forces counts for Kitsap County in Table 13, reflects changes in the number of ships and naval personnel at the Puget Sound Shipyard. Specific rules established by the Bureau of the Census are used to determine where large transient military populations are counted.

Estimates of the armed forces personnel by county are developed from federal census data, station strength counts published by the United States Department of Defense and information provided by the major military installations in Washington.

Armed forces figures represent persons on active duty with the United States Army, Navy, Air Force, Marine Corp or Coast Guard. The figures include personnel residing on base, in military housing, barracks and other group quarters, including ships. Personnel who live outside the military reservations are also included. The dependents of military personnel are excluded from the tabulations.

Large differences exist in the number of armed forces population by state. In 1980, California ranked first with a count of 263,413, followed by Texas at 148,608 and Virginia at 140,721. Washington ranked ninth with 53,268 and Vermont ranked last with only 274.

Note: Armed Forces personnel reflects resident military personnel as defined by the U.S. Bureau of the Census. Annual estimates are developed on the basis of July 1 station strength counts by the Department of Defense and information provided by military installations in Washington. Sharp variations in the figures for Kitsap County reflect changes in the number of ships and naval personnel at the Puget Sound Naval Shipyard.

TABLE 13B

Note: Armed Forces personnel reflects resident military personnel as defined by the U.S. Bureau of the Census. Annual estimates are developed on the basis of July 1 station strength counts by the Department of Defense and information provided by military installations in Washington. Sharp variations in the figures for Kitsap County reflect changes in the number of ships and naval personnel at the Puget Sound Naval Shipyard.

## **Components of Population Change**

Births, deaths, immigration and outmigration are the four components of population change. The excess of births over deaths is called natural increase. The excess of immigration over outmigration is called net migration. These factors all operate on the population in an age selective fashion. Table 14 summarizes the trends in population change from 1910 to 1988.

### **Fertility**

The number of births reached its all time low of 20,882 in 1933. This event was the turning point of a long time decline in the number of annual births and in the number of births the average woman would have during her child-bearing years. Women were averaging only 1.6 births at the depth of the Depression.

The economy recovered, the war ended and the baby boom began. By the mid-1940s the annual number of births had more than doubled and women were averaging three babies during their child-bearing years. The boom peaked in 1957 when calendar year births exceeded 65,900. At that time women were averaging greater than 3.7 births.

The women born at the beginning of the baby boom reached maturity in the mid-1960s. The expected new wave of large birth cohorts did not materialize. Both the number of births and the average number of births per woman began a decade long decline that has been referred to as the baby bust. In 1972 the annual number of births fell below 50,000 for the first time in 25 years. In 1975, the average number of births per woman, 1.7, approached the 1933 low.

In 1982 the state recorded more than 70,000 resident births. However, the average number of births per woman was only slightly above the 1975 level. The women born in the late 1940s and early 1950s were finally having children. This phenomena is known as the echo effect.

Increased female labor force participation, an increase in the age at first marriage, an increase in the divorce rate and an increase in female educational attainment are the primary factors explaining an increase to only 1.8 births per woman.

### **Mortality**

In the 1920s the average annual number of deaths was approximately 15,000 persons. The state reached the level of 30,000 annual deaths for the first time in 1968.

Life expectancy at birth is an important driver of death statistics. In the 1920s the life expectancy for males was 58 years and for females 60 years. Nearly 10 percent of the deaths in the 1920s were infants. At that time there were 56 deaths for every 1,000 live births. By 1960, life expectancy had increased to 68 years for males and to 75 years for females. The improvement in the number of infant deaths was remarkable, only 23 of every 1,000 live births. In 1980 life expectancy was 72 years for males and 79 years for females. Infant deaths were less than 3 percent of total deaths, a rate of 12 for every 1,000 births.

### **Net Migration**

Migration is the most difficult component of population change to gauge. For the most part, migration reflects population movement induced by economic opportunities. While some selected streams may consist of elderly retired persons or refugees, whose movement is unrelated to employment opportunities, the bulk of interstate movers are young adults responding to positive or negative job opportunities.

Population gains or losses involving young adults in family formation serve to increase or decrease the pool of potential parents in a given population. This has a direct impact on fertility levels.

Historically, Washington has exhibited a cyclical pattern of migration associated with expansions and contractions in the state's economy. Net migration gains during rapid economic expansion periods have usually far exceeded prior population losses.

The increasing prominence of nonmanufacturing employment in the state, relative to manufacturing employment, is expected to produce slower but more stable employment growth. This growth may be slower than the state experienced in previous years. Yet, the cumulative impact is substantial as migration continues to play a major role in state growth.

## Notes:

<sup>1</sup> Births per 1,000 women aged 15 to 44 years.

<sup>2</sup> Calendar year figures for 1930 to 1960, April-to-April figures for 1961 to present.

<sup>3</sup> Corrected 1970 population from the Census Bureau; actual 1980 census count.

<sup>4</sup> 1988 births are estimated.

**Notes:**

<sup>1</sup> Includes Interim Series of 1970 to 1980 Intercensal Estimates, developed May 1981.

<sup>2</sup> Calendar year figures.

<sup>3</sup> Marriages and divorces per 1,000 population.

<sup>4</sup> Revised 1981 estimate (see Table 2).

<sup>5</sup> Marriage licenses issued; other data reflect marriages performed.

## **Estimates and Forecasts for Counties**

The 1980 county populations presented in Table 17 are from the federal census. The 1985 figures are estimates that were developed for state revenue sharing purposes. The forecasted populations for 1990, 1995 and 2000 were developed from historical population trends.

The county forecast was prepared in July 1986. The primary factors in the calculation were demographic rather than economic. The current and future social and economic conditions observed at the time of the forecast guided the choice of factors. The controlling assumptions of the forecast are consistent with those published in, *Forecasts of the State Population by Age and Sex: 1986-2010*, released by the Office of Financial Management (OFM) in December, 1985.

The forecasted county totals were calculated with the assumption that the historical relationship between a county's growth and the state's growth would prevail for the next 15 to 20 years. In some instances the extrapolation of a trend would yield unreasonable results. Therefore, further analysis was undertaken to assess the reasonableness of the projections. This analysis focused on the changing share of the state population implied by the continuation of historical patterns. Some adjustments were made when appropriate. The resulting populations were then controlled to state totals.

The forecast presented here is a top-down forecast. Although the county populations were developed individually, the methodological approach assumed that as a group they would not deviate from the figures calculated in an independent forecast of the state's population. The primary reason for this approach is the known stability and behavior of large numbers in mathematical equations. More intuitively, the growth of the counties occurs in the context of the growth of the state. County borders are permeable. There is an interdependence of growth and development.

The state forecast is based upon a cohort component methodology. The components of population change, births, deaths and net migration, are recorded and projected for age by sex cohorts.

## Preface

Population Trends provides current demographic data for the state, counties, cities, and towns. The population figures presented, unless otherwise noted, represent all the persons who usually reside in the area designated. This includes military personnel, military dependents, persons living in correctional institutions, persons living in nursing homes and other care facilities. College students are considered residents of the place where they live while attending school. Seasonal populations, such as vacationers or migrant farm workers are considered residents of the home they consider their usual residence. Persons without a usual residence are residents of the place where they are located on April 1.

The 1989 population estimates for cities and towns presented in Table 2 will be used in the allocation of state revenue beginning January 1990 (RCW 43.62.030). The 1989 estimates of population in unincorporated areas will be used to allocate liquor profits to counties beginning September 1989 (RCW 66.08.200) and liquor excise tax revenue beginning October 1989 (RCW 82.08.170).

Notable changes in the content of Population Trends are: the addition of median household money income estimates for counties; estimates of persons age 16 through 64 years with a work related disability, also by county; and population forecasts by age for counties. Estimates of the state's population by broad racial categories and for the Spanish Origin population will be released in a separate document when the vital statistics used in their preparation become available.

Should you have any questions or suggestions regarding the content of this publication, please contact the Forecasting Division of the Office of Financial Management, (206) 753-5617.

## Acknowledgements

Special thanks are given to the following persons and agencies because of their continued help and cooperation in the annual publication of Population Trends: the Vital Statistics Health Data Section, Department of Social and Health Services, for supplying vital statistics data; the Office of Research and Data Analysis, Department of Social and Health Services, for providing selected institutional population counts; the Department of Veterans Affairs, for furnishing veteran institutional counts; the housing directors of the colleges and universities, for submitting April 1 dormitory counts; the Armed Forces personnel at major bases in the state for contributing data on current resident military counts; and all of the city staff, and county and regional planners for providing data used in the development of the April 1 population estimates.

## April 1 Population Estimates

The state, county, and municipal population figures presented in this publication are primarily population estimates. The figures are developed as accurately as possible from standard and tested techniques. The methods used to develop the state, county, and city populations differ due to the availability of data.

### The State Estimate

The April 1, 1989 total resident population is 4,660,700. This estimate is developed by a component method. Population change for persons under the age of 65 is determined by natural increase (births minus deaths) since the last census and net migration developed from school enrollment data. Medicare enrollment is used to estimate the number of persons 65 years and older. The approximate error in the state population estimate is one to two percent.

Many state programs and policies are directed at persons in particular age and sex groups. For example, some state programs focus on the preschool population, others on school-age children, or on the elderly. Thus, the age and sex characteristics of the population are essential information to many analysts responsible for funding specific programs. Table 1 and Figure 1 present the state's population by standard age groupings.

### County and Municipal Estimates

The population determinations shown in Table 2 for cities, towns, and counties are prepared for use in the allocation of revenues to local governments. This table provides a record of the population figures used for revenue purposes since 1980. Unless noted, the figures have not been changed or revised subsequent to their official publication.

Three methods are used to develop estimates of persons residing in counties. The two primary methods are the component method, described above, and the ratio correlation method. Ratio correlation is a regression technique that relates population change to change in one or more sets of symptomatic data. The current equation uses school enrollment, registered voters, auto registrations, and wage and salary employment. The housing unit method, which is discussed below, is used as a supplemental method. The average absolute error in the county estimates is between three or four percent.

Population determinations shown in Table 2 for cities and towns are both estimates and actual population counts. Each year, about thirty cities elect to conduct a census for their annual population determination. Estimates are prepared for the remaining cities using the housing unit method. This method builds on the most current federal or special census taken by a county or city. The underlying assumption of the housing unit method is that people usually live in homes or in some type of group living facilities called "group quarters." Examples of group quarters are college dormitories, social houses, military barracks, nursing homes or other long term care facilities, and correctional institutions. Homeless persons are counted as part of the group quarters population. Persons living in houses, plus persons living in group quarters equal the total population of an area. Persons who reside at more than one house are generally considered a resident of the place where they spend the majority of the year.

The number of persons in households is estimated by applying an occupancy rate and then the average number of persons per occupied unit to the housing stock in an area. The change in the number of

persons living in group quarters since the last census is updated by contacting each facility. The accuracy of the housing unit estimation method depends on accurately determining all of the factors required in the calculations: the current housing stock, the occupancy rate, and average household size. A federal census or special census provides more than a glimpse of city or county population at one point in time. It provides benchmark data on the number of housing units, the occupancy rate, and the average number of person per occupied house. In practice, average household size is usually trended based on the change in household size between the last two census points. The occupancy rate at the last census point is usually used in developing the population estimate. Sometimes more recent occupancy data may be available, but extreme care must be used because most occupancy surveys do not cover all housing units in the estimation area, or use a similar definition of occupancy.

Each year, population determinations are developed from the most current data available. Often figures are not comparable from year to year due to data corrections or the use of new information that was not available when the prior estimates were prepared. To evaluate the population change for any area, the most valid comparison is between the last census count and the current estimate. Other comparisons may be misleading due to differences in the data determining the population. In this respect, it should be noted that in 1988, as part of the preparation for the 1990 decennial census, the federal Bureau of the Census conducted population and housing counts in rural areas of Eastern Washington. Censuses were conducted in the following counties: Adams, Chelan, Douglas, Ferry (part), Franklin, Grant, Kittitas, Lincoln, Okanogan (part), Stevens (part), and Whitman. The results of the Bureau's counts were used in developing 1989 population estimates for local jurisdictions in the censused areas.

Other tables in this section show population change and sources of change for Washington's cities and counties. Table 3 shows population change and components of population change by county since 1980. Births and immigration contribute to population growth, while deaths and outmigration produce population decline. Natural increase (births minus deaths) is usually a source of growth for most counties. Net migration (immigration minus outmigration) is more variable and generally reflects the economic conditions in an area. The estimate of net migration is derived by subtracting the gain due to natural increase from the change in population.

Cities are ranked by their 1989 population size in Table 4, with their 1980 rankings provided for comparison. Most of the large changes in rankings are due to annexation or incorporation. Tables 7 and 8 provide specific information on municipal boundary changes in Washington.

**NOTES:**

1. The county and municipal populations shown for 1980 are, with a few exceptions, the 1980 federal census final counts. Jurisdictions will be advised if any further corrections are received. Federal census counts have been adjusted for annexations from January 1, 1980 to April 1, 1980.
2. (\*) State Certified Special Census. A population and housing count that meets all special census certification requirements. Also indicates cities and towns with March 1, 1980 city special census count greater than the federal 1980 census count.
3. (#) Informal Count. A population and housing count that is considered accurate but does not meet all special census certification requirements.
4. (+) Informal Count. A population count that is considered accurate but does not meet all special census certification requirements.
5. The 1981 estimates have been revised on the basis of corrections to the 1980 census counts that were provided by the federal Bureau of the Census in correspondence dated August 18, 1981 and February 18, 1982.

(\$) Indicates a correction to the 1980 census count and/or a revised 1981 estimate.

With the exception of corrections to the federal census counts, annual estimates in this official series are not revised on the basis of other information that becomes available after the estimate date. As a result, population estimates shown for the individual years, from 1981 through the current estimate date, may not be comparable. Figures often vary due to data corrections or the use of new survey or census data that are not available on an annual basis. Revised county estimates are published regularly in the Components of Population Change Section in Population Trends for Washington State.

6. Mill Creek incorporated in September, 1983.
7. The federal Bureau of the Census, in preparation for the 1990 decennial census, conducted 1988 population counts in Adams, Chelan, Douglas, Franklin, Grant, Kittitas, Lincoln, and Whitman counties, and in parts of Ferry, Okanogan, and Stevens Counties. These 1988 counts were considered in the development of the state's official 1989 population determinations.

## Population Trends Since 1980

### Population Change in Washington State

Since 1980, the number of persons residing in the State of Washington has increased by about 528,300. This increase represents an average annual rate of growth of approximately 1.3 percent. This is somewhat slower than during the 1960s and 1970s when the state's average growth rate was about 2 percent per year. Average growth rates, however, are somewhat deceptive. Washington's growth has not been a steady, even-paced, phenomena. There have been periods of stagnation and periods of rapid gain.

Annual data on Washington's population provided in Table 14 reveal that the state entered the 1980s at the crest of a tremendous growth cycle (nearly 4 percent a year from 1977 to 1980). A decline in the annual rate of growth followed during the early 1980s when the population was growing at a rate of 2.3 percent per year. By April 1983, however, population growth had stalled, and the state experienced a net outmigration of nearly 16,000 persons. The state's economy increased in strength during the later part of the decade and has grown at a rate of about 2 percent per year since 1987.

Population growth and decline is accounted for by births, deaths, and migration. Birth and death data are collected continuously and are assumed to be reasonably complete and accurate. The increase in Washington's population due to the surplus of births over deaths, often referred to as natural increase, tends to be consistent and not readily noticed. Natural increase, however, has accounted for 60 percent of the state's growth since 1980.

Large or sudden population change is usually the result of dramatic swings in migration. Migration is the most difficult component of population change to estimate or predict. At the state level, estimates of net migration (immigration minus outmigration) are developed by annual tracking of school-age migration and wage and salary employment change. During the last nine years the state experienced both gains and losses due to net migration. Approximately 40 percent of the increase in state residents, about 206,000 persons, can be attributed to net migration.

### Geographic Distribution of Population Change

The geographic distribution of population change varies throughout the state. During the 1970s about 75 percent of the state's population lived in Western Washington. Since 1980, however, the proportion of the population in Western Washington has increased to 77 percent. This is due to the fact that most of the state's growth since 1980 is concentrated in the large metropolitan counties bordering on Puget Sound. Growth in King, Kitsap, Pierce, Snohomish, and Thurston Counties accounts for 77 percent of the state's total increase of 528,300 between 1980 and 1989.

Table 3 shows both the numerical change and rate of change for counties since the 1980 census. The rate of population growth reflects some of the challenges faced by local governments and organizations as their population grows or declines. The rate relates the pace of population growth to the size of the population at the time the of last decennial census. Of the seven counties showing growth rates of 20 percent or more, all are located in Western Washington. Snohomish (27.4), Island (25.5), Thurston (24.8), and San Juan (23.8) show the largest percent increases.

Counties have large differences in their components of population change. Growth in San Juan County, for example, is mostly the result of migration rather than natural increase. Overall, migration has more of an impact on county growth than state growth. Migration accounts for 40 to 60 percent of the growth in most rapidly growing counties. Twenty-three counties have experienced net losses due to migration since 1980 (Table 3).

One way to evaluate population change in a county is to study the components of change (births, deaths, and migration). In the state as a whole, there are roughly twice as many births as there are deaths. Some counties experienced nearly equal numbers of births and deaths while other counties have over three times as many births compared to deaths. Benton and Franklin Counties, for example, each have over three times as many births than deaths between 1980 and 1989, resulting in a substantial amount of natural increase. These high levels of natural increase helped offset the impact of high levels of net outmigration. Similar examinations of the relationship between natural increase and migration, in combination with the history of population growth, can be examined for each county. Evaluations of this type yield important information on the character and timing of population change for a county or counties of interest.

#### **Population in Cities and Towns**

The population of Washington State resides in either incorporated places or in the unincorporated portions of a county. The proportion of the state's population living in cities and towns declined from 51 percent in 1980 to 49 percent by 1989 (Table 2). Counties east of the Cascades are typically characterized by large portions of their populations in cities and towns. Counties in Western Washington generally have more sizable populations in unincorporated areas. The ten fastest growing counties in the state, all on the western side of the Cascades, could credit most of their population growth to their unincorporated areas. Population growth in unincorporated areas generally outpaces the growth in cities and towns.

Territorial expansion is a major source of city growth. Municipal boundaries have expanded to include more people, or to encompass undeveloped land that is later subject to development. Between 1980 and 1989, cities and towns increased their land area by 124 square miles. At the time of annexation, 56,840 people lived in the areas annexed. Detailed information on annexations and other boundary changes is discussed in the following section.

Notes:

1980 census count corrections include King (149), Kitsap (534), Lewis (746), Pierce (24), Snohomish (704), and Okanogan (24) counties.

The 1981 estimates for the state and counties were revised when 1980 census age data became available and will not match the unrevised state and county estimates shown in Table 2.

Vital events are estimated for January 1988 through March 1989. Detail may not add due to rounding.

OFM/Forecasting 7/89

**Notes:**

The county and municipal housing units shown for 1980 are, with a few exceptions, the 1980 federal census final counts. Federal census counts have been adjusted for annexations from January 1, 1980 to April 1, 1980.

Mill Creek incorporated in September, 1983.

(\*) The mobile home and trailer data for most unincorporated areas exclude changes in mobile home parks for all or part of the 1980-89 reporting period. Mobile home and trailer losses tend to be underreported. The number of mobile homes and trailers in areas that have experienced a large outmigration (such as Benton and Grays Harbor Counties) will tend to be overestimated.

Housing unit estimates are revised on an annual basis to include the most current data available.

In a few cases, the 1980 federal census data have been proven to be in error by subsequent censuses (e.g., Gold Bar, La Center, and Palouse).

In the 1980 federal census, 15 to 20 percent of the mobile homes and house trailers in Washington were classified as single family houses. A negative figure in the mobile home/trailer category indicates a city has lost more mobile homes/trailers than were counted in the 1980 census. When using the housing data, the negative numbers should be subtracted from single family housing.

## Annexations, Incorporations, and Other Municipal Boundary Changes

The Office of Financial Management (OFM) is responsible for certifying the total number of persons and housing units in annexed areas. Municipalities must conduct a census of all population and housing in annexed areas. Annexation censuses provide accurate counts of population, housing, occupancy rates, and average household size. While OFM certifies the annexation census it does not certify that the annexation is free from error or that it is legal.

The annexation census data are used in producing OFM's annual April 1 population estimates. In addition, municipal population estimates are updated quarterly to include all populations annexed from the base year estimate to the current date. State revenue allocations to municipalities are made on the basis of these adjusted population estimates.

The certified figures are required by many state and federal agencies. Geographers at the federal Bureau of the Census and the Washington State Department of Transportation use the certified data to update municipal boundary maps.

Since 1980, more than 75 percent of Washington's 266 cities and towns have made boundary changes and added 124 square miles to the total incorporated land area. These annexations, and the incorporation of Mill Creek in 1983, included 24,227 housing units which were homes for 56,840 people. The incorporated land area is now slightly greater than 1,121 square miles, approximately 2 percent of the total land area in the state.

Five cities annexed over 2,000 persons since 1980: Kirkland, 16,467; Des Moines, 5,036; Kennewick, 3,670; Bellevue, 2,919; and Mukilteo, 2,834. In some cases, all of the population growth in cities can be credited to annexations. Thirty-five percent of the 163,403 increase in incorporated population between 1980 and 1989 can be credited to the Mill Creek incorporation and the population in areas annexed.

Two cities, Roy, in Pierce County, and Port Orchard, in Kitsap County, have repealed approved annexations during the 1980s.

In March of 1988, a favorable vote approved the annexation of four separate parcels of land to Tukwila which contained 6,033 people. The population in this annexation will appear in Tukwila's official population determination for 1990 as all annexation certification requirements were fulfilled after April 1 of 1989. In March of 1988, voters also approved the establishment of two new cities in King County, Federal Way and Sea-Tac. These two new incorporations will become effective in early 1990. The Federal Way incorporation contains approximately 58,000 people and the Sea-Tac incorporation contains about 24,000 people.

**Notes:**

\* Includes annexations, incorporations and other municipal boundary changes. Annexed areas of less than .001 square miles are shown as 0.000 square miles.

\*\* Land area for 1980 was primarily supplied by municipal officials.

OFM/Forecasting 7/89

## Growth of Households

Estimates of households for the state and counties are provided in Table 9. Households, as defined by the federal Bureau of the Census, are occupied housing units. Housing units used on a seasonal basis, such as vacation homes, are considered vacant even though they are occupied for part of the year. The number of households reported in Table 9 for 1970 and 1980 are census counts of the number of occupied housing units. The 1989 estimate is based on the data provided by cities and counties. The occupancy rates used to produce the estimates were derived from the 1980 census and subsequent special censuses and surveys used in developing the current municipal estimates.

Throughout the 1970s and 1980s the number of households has grown at a faster pace than population. Since 1980, the number of households has grown at an average annual rate of 1.9 percent while the population has grown at a rate of 1.3 percent. The faster growth of households in comparison with the much slower growth of population is partly due to the long term decline in average household size. In Washington State in 1960 the number of persons per household was 3.09. By 1970 the number was 2.93 and the 1980 census recorded a number of 2.61. The number of persons per household in Washington has continued to fall and now approximates 2.49 person per household. The decline in household size has not been as pronounced in all regions of the state. It has also differed according to the type of structure.

The decrease in household size is the result of several social changes. The most evident is fewer children in families. Thirty years ago, most mothers were having three or four children, today one or two is the norm. Divorces, separations, and abandonments have also led to smaller households. In addition, men and women now marry later. These events often lead to a rise in occupancy rates. Yet, it appears that more housing units are being occupied by the same or a smaller number of people. The normal progression of the family life cycle is also responsible for the decline in the average number of persons per occupied household. When the youngsters are out of high school, they often leave the family home to go out on their own, off to college, or into the military. In many cases, these young adults cannot afford to locate in the same community as their parents. Housing may be too expensive, transportation too arduous, or the economy may not be able to absorb them.

The increase in life expectancy is another contributing factor to the decline in household size. Widows and widowers are frequently living on their own. Many cities are reporting the completion of new apartment units built specifically for the elderly. Data indicate that these units predominantly tend to have only one occupant each. Again, occupancy may be greater, but the population may fall, since the average household size is small.

Changes in population size and characteristics of households are of significant interest to policy makers at both the state and local level. Efforts to learn more about households are underway. These efforts are fueled by new information and data being gathered. Data from the 1990 census will contribute to a better understanding of both the size and characteristics of households. In addition, in preparation for the 1990 census, the federal Bureau of the Census conducted a test census in 1988 of much of Eastern Washington. These data are just now becoming available for analysis.

OFM/Forecasting 7/89

## The Population 65 Years and Older

Persons 65 years and older continue to be one of the fastest growing segments of the population. This elder population constituted 9.9 percent of the total U.S. population in 1970, 11.3 percent in 1980, and 12.2 percent in 1987, the last year for which national data are available.

Compared with the nation, persons 65 and older are a smaller proportion of Washington's population, but their numbers are growing faster. Elders comprised 9.5 percent of the state's population in 1970, 10.4 percent in 1980, and 11.8 in 1987. In 1989 they are an estimated 12 percent of the state total.

The elder population is not only growing in size, it is also aging. Between 1980 and 1989, the number of Washington residents age 65 to 74 rose 23.2 percent. However, the rate of increase among persons 75 and older was even higher. The number of persons age 75 through 84 increased by 36.5 percent and the 85 and older group increased by 37.5 percent. In 1980, the elderly age 65 to 74 comprised 61 percent of Washington's elderly and persons 85 years and older represented 9.6 percent of the elderly. Persons 85 years and above now comprise 10.5 percent of the elderly and the proportion 65 through 74 years has declined to 58.5 percent. Persons age 75 and older are expected to increase as a proportion of the elderly population until just after the turn of the century; at which time the leading edge of the baby boom turns 65 years.

The growing number of elders and their changing age distribution have important consequences for Washington's citizens. The elderly population is not homogeneous. Persons between 65 and 74 years generally enjoy unprecedented health and adequate income. Persons 85 years and older, however, face increased disability, chronic illness, and poverty. As more people reach advanced old age, more personal, family, and government resources are required to provide for their long term health care. Nursing home utilization, as one indicator of serious disability and health care needs illustrate this point. In 1980, one quarter of all Washington residents 85 and older were living in nursing homes compared to less than 2 percent of the elders under 75 years.

Census counts and estimates of Washington's population 65 years and older are shown in Table 10. Table 11 provides the population 65 and older as a percent of the total population by county. These estimates of the elderly population are developed from changes in Medicare enrollment that includes most elders.

A considerable variation exists across counties in the proportion of residents 65 years and older. Whitman County, with its large university student population, has the lowest percentage of elder residents in 1989 (9.5 percent). Next is fast growing Snohomish County with 9.7 percent. Although this county's elderly population has increased by 41.9 percent since 1980, rapid growth in the number of younger residents has kept its proportion of elders below the state average.

In five counties, persons age 65 years and older comprise one-fifth or more of the population. The largest concentration of elderly is in Garfield County. Nearly 22 percent of Garfield's population is elderly, primarily due to a loss of population at younger ages. The other four counties with the highest proportion of elders are on the coast: Pacific, Clallam, Jefferson, and San Juan. Pacific County has had a lower than average rate of growth in the elderly population, but expansion among other segments of the population has been small. In the other three counties, the elderly population increased by over 40 percent since 1980, outstripping the growth of the population under 65 years.

Three additional counties, Thurston, Mason, and Island, experienced over 40 percent growth in the elderly population since 1980. However, substantial increases among younger age groups kept the elder representation in these counties between 13 and 16 percent.

Note:

This series of estimates corrects for the coverage errors in the 1970 census and will not match previously published estimates of the population age 65 years and over. A state level adjustment factor was used to correct 1970 census county population as more detailed correction factors were not available. The state correction factor was developed from series SOR 31-WCF-1 BACF-1 described in Demographic Estimates of the Coverage of the Population of States in the 1970 Census: Demographic Analysis, Current Population Reports, Series P-23, No. 65, released by the Bureau of the Census in a memorandum to the Federal State Cooperative Program members, April 6, 1983.

OFM/Forecasting 4/89

Note:

This series of estimates corrects for the coverage errors in the 1970 census and will not match previously published estimates of the population age 65 years and over. A state level adjustment factor was used to correct 1970 census county population as more detailed correction factors were not available. The state correction factor was developed from series SOR 31-WCF-1 BACF-1 described in Demographic Estimates of the Coverage of the Population of States in the 1970 Census: Demographic Analysis, Current Population Reports, Series P-23, No. 65, released by the Bureau of the Census in a memorandum to the Federal State Cooperative Program members, April 6, 1983.

OFM/Forecasting 4/89

OFM/Forecasting 7/89

## Resident Institutional Population

The 1989 populations shown for Washington's cities, towns, and counties in Table 2 include approximately 114,500 persons living in group quarters facilities. Of this total, 11,309 reside in state and federal correctional institutions, long term care facilities for the mentally or physically disabled, and veteran homes. Counts of the resident population in institutions that are under state or federal jurisdictions are relatively easy to obtain and often identify a major source of population change for local governments.

The 1989 population of Buckley, in Pierce County, includes 560 residents at Rainier School. The school's population represents 18 percent of Buckley's 3,100 city residents. A decline of 218 residents at Rainier School since 1980 has contributed to a decline in Buckley's population.

The institutional figures shown for Mason County in Table 12 represent a count of the resident inmates at the Washington Corrections Center at Shelton and the Mission Creek Youth Camp. The inmate population at the Corrections Center remained relatively stable from 1970 to 1979, ranging from about 600 to 700 residents. Due to an expansion of the facility, the inmate population increased from 776 in 1980 to 1,584 by 1984. This increase accounted for 22 percent of Mason County's population growth over the 1980 to 1984 period.

The 1989 institutional population of 1,153 shown for Spokane County in Table 12 includes 260 persons in correctional facilities in the unincorporated area and 893 persons in three long-term care facilities located within the corporate limits of Medical Lake. Patients at Eastern State Hospital and persons with developmental disabilities living at Interlake School and Lakeland Village represent 24 percent of Medical Lake's total 3,760 residents. The institutional population in these three facilities represented over 50 percent of Medical Lake's population at the start of the 1970s, but declined by over 1,000 through the decade.

The selected institutional populations shown in Table 12 represent approximately ten percent of the state's total group quarters population. Other group quarters populations that are a source of local area population change include persons in nursing homes, college dormitory populations, and military personnel living in barracks and on ships.

Note:

These counts include persons in state and federal mental and penal institutions, veteran's homes, and schools for the deaf, blind, and retarded. These counts exclude persons in adult correction work release facilities, diagnostic centers, and group homes.

OFM/Forecasting 4/89

## Resident Armed Forces Personnel

The 1989 estimate of resident armed forces personnel for the State of Washington is 61,845. Most of the fluctuations in the estimates is due to changes in the number of ships being overhauled at the Puget Sound Naval Shipyard in Bremerton. The shipboard personnel count at the shipyard was 1,730 in 1980, over 4,000 in both 1981 and 1985 and only 372 in 1987. The count increased to 3,463 in 1988 due to the arrival of the Nimitz and then declined slightly to 2,888 in 1989. Due to increases in more permanent military personnel since 1980, the state's armed forces total does not drop below 59,000, even when the counts of shipboard population at Bremerton are minimal.

Table 13 provides federal census counts and estimates of the resident armed forces population by county. Resident armed forces personnel are included in the resident population counts and estimates for the state, counties, and local governments. These annual estimates provide a basis for determining civilian labor force figures, civilian population movement, and other information for the civilian population that is combined together with large military populations.

The importance of the military population in the state can be derived from data collected in the early 1970s. Washington recorded a net outmigration of 28,700 persons between 1971 and 1972. Figure 2 shows that the level of outmigration was high enough to cause the state's population to decline. The decline is usually attributed to the sharp reduction in aerospace employment at Boeing. Actually, a troop reduction of over 15,000 at Fort Lewis accounted for over one-half of the state's net outmigration during this period. It took more than a decade for the number of armed forces personnel to again reach 1970 and 1971 levels.

Changes in the armed forces population often cause noticeable changes in local area populations. This is particularly true for naval port cities that are subject to large differences in shipboard populations. The sharp variation in the population estimates for Bremerton and Kitsap County in Table 2, and in the armed forces counts for Kitsap County in Table 13, reflect changes in the number of ships and naval personnel at the Puget Sound Naval Shipyard. Specific rules established by the Bureau of the Census are used to determine where large transient military populations are counted.

Estimates of the armed forces personnel by county are developed from federal census data, station strength counts published by the United States Department of Defense, and information provided by the major military installations in Washington.

Armed forces figures represent persons on active duty with the United States Army, Navy, Air Force, Marine Corp, and Coast Guard. These figures include personnel residing on base, in military housing, barracks, and other group quarters, including ships. Personnel who live outside the military reservations are also included. The dependents of military personnel are excluded from the tabulations.

Large differences exist in the number of armed forces population by state. In 1980, California ranked first with a count of 263,413, followed by Texas with 148,608, and Virginia with 140,721. Washington ranked ninth with 53,268 and Vermont ranked last with only 274.

Note:

Armed Forces personnel reflects resident military personnel as defined by the federal Bureau of the Census. Annual estimates are developed on the basis of July 1 station strength counts by the Department of Defense and information provided by military installations in Washington. Sharp variations in the figures for Kitsap County reflect changes in the number of ships and naval personnel at the Puget Sound Naval Shipyard.

Note:

Armed Forces personnel reflects resident military personnel as defined by the Federal Bureau of the Census. Annual estimates are developed on the basis of July 1 station strength counts by the Department of Defense and information provided by military installations in Washington. Sharp variations in the figures for Kitsap County reflect changes in the number of ships and naval personnel at the Puget Sound Naval Shipyard.

OFM/Forecasting 7/89

## Components of Population Change

Births, deaths, immigration, and outmigration are the four components of population change. The excess of births over deaths is called natural increase. Immigrants, less outmigrants is called net migration. These factors all operate on the population in an age selective fashion. Table 14 summarizes the trends in population change from 1910 to 1989.

### Fertility

The number of births reached its all time low of 20,882 in 1933 (Figure 2). This event was the turning point of a long term decline in the number of annual births and in the number of births the average woman would have during her child-bearing years. Women were averaging only 1.6 births at the depth of the Depression.

The economy recovered, the war ended, and the baby boom began. By the mid-1940s the annual number of births had more than doubled and women were averaging three children during their child-bearing years. The boom peaked in 1957 when calendar year births exceeded 65,900. At that time women were averaging greater than 3.7 births.

**Figure 2**  
**Births and Births per 1,000 Women 15-44 Years**  
**State of Washington, 1920 to 1989**

The women born at the beginning of the baby boom reached maturity in the mid-1960s. The expected new wave of large birth cohorts did not materialize. Both the number of births and the average number of births per woman began a decade long decline that has been referred to as the baby bust. In 1972 the annual number of births fell below 50,000 for the first time in 25 years. In 1975, the average number of births per woman, 1.7, approached the 1933 low.

In 1982 the state recorded more than 70,000 resident births. However, the average number of births per woman was only slightly above the 1975 level. The women born in the late 1940s and early 1950s were finally having children. This phenomena is known as the echo effect. Increased female labor force participation, an increase in the age at first marriage, an increase in the divorce rate, and an increase in female educational attainment are the primary factors explaining an increase to only 1.8 births per woman. Fertility rates are expected to remain low, but the number of annual births in the state will remain at about 70,000 due to the large number of women in child-bearing ages.

### Mortality

In the 1920s the average annual number of deaths was approximately 15,000 persons. The state reached the level of 30,000 annual deaths for the first time in 1968. Deaths are now approximating 35,000 per year.

Life expectancy at birth is an important driver of death statistics. In the 1920s the life expectancy for males was 58 years and for females 60 years. Nearly 10 percent of the deaths in the 1920s were infants. At that time there were 56 deaths for every 1,000 live births. By 1960, life expectancy had increased to 68 years for males and to 75 years for females. The improvement in the number of infant deaths was remarkable, there were only 23 deaths for every 1,000 live births. In 1980, life expectancy was 72 years for males and 79 years for females. Infant deaths were less than 3 percent of total deaths, a rate of 12 for every 1,000 births.

### Net Migration

Migration, as a component of population change is presented in Figure 3.

**Figure 3**  
**Population Change and Net Migration**  
**State of Washington, 1951 to 1989**

Migration is the most difficult component of population change to gauge. For the most part, migration reflects population movement induced by economic opportunities. While some selected streams may consist of elderly retired persons or refugees, whose movement is unrelated to employment opportunities, the bulk of interstate movers are young adults responding to positive or negative job opportunities. Population gains or losses involving young adults engaged in family formation serve to increase or decrease the pool of potential parents in a given population. Thus, the size of this age group has a direct impact on fertility levels.

Historically, Washington has exhibited a cyclical pattern of migration associated with expansions and contractions in the state's economy. Net migration gains during rapid economic expansion periods have usually far exceeded prior population losses. The increasing prominence of nonmanufacturing employment in the state, relative to manufacturing employment, is expected to produce slower but more stable employment growth. This growth may be slower than the state experienced in previous years. Yet, the cumulative impact is substantial as migration continues to play a major role in population growth.

**Table 14**  
**Components of Population Change**  
**State of Washington, 1910 to 1989**

(Figures in Thousands)

-----Components of Change From Previous Period-----

**Notes:**

Corrected census counts for 1970 and 1980. The 1981 state estimate was revised when 1980 census age data became available and will not match the unrevised state estimate shown in Table 2.

Vital events are calendar year figures for 1920 through 1940 and April to April figures for 1950 to 1989. Vital events are estimated for January 1988 through March 1989.

Rates are calculated per 1,000 midpoint population and computed on unrounded numbers.

**Notes:**

The general fertility rate is births per women 1,000 15-44 years.

Calendar year figures for 1930 to 1960 and April to April figures for 1961 to 1989.

Corrected census counts for 1970 and 1980.

Births are estimated for January 1988 through March 1989.

Notes:

Corrected census counts for 1970 and 1980. The 1981 state estimate was revised when 1980 census age data became available and will not match the unrevised state estimate shown in Table 2.

The marriage/divorce rate is marriages/divorces per 1,000 population.

Calendar year figures for marriages and divorces. The 1950 data are licenses issued; the other data are marriages performed.

OFM/Forecasting 7/89

## Estimates of Median Household Money Income

Estimates of the median money income of households in Washington and its 39 counties are provided in Table 17.

### Definition of Median Household Money Income

"Money income" is the definition of income used by the federal Bureau of the Census. This definition excludes some of the components of "personal income," the definition of income used by the U.S. Department of Commerce, Bureau of Economic Analysis. For example, employer paid pension and medical benefits are included in personal income, but not in money income. The median is the point at which half of all households have more income, and half have less. This differs from the mean, or average income, which would be calculated by summing the incomes of all households and then dividing by the total number of households. Primarily because a few households have very high incomes, the median income is somewhat lower than the mean income. A household with an annual income of \$1 million can have a substantial impact on average income, especially in a county with a small population. However, the impact of such an unusual household on median income is much less, since a household whose income is \$1 above the median has as much impact as a household \$1 million above it.

### Data and Methodology

The source of the data for 1979 in Table 17 is the 1980 census. Because of the comprehensive nature of the decennial census, the data for 1979 are highly reliable, even though totally accurate answers to census income questions cannot always be obtained. The data for years subsequent to 1979 have been estimated based on available county economic and demographic data, plus a number of judgemental factors. County economic and demographic data series used in the estimation of median income are: per capita income, non-agricultural employment, population, total employment, and total earnings.

The data for years after 1979 are based on estimates rather than a census and are not as reliable as the 1979 data. This is especially true for less populous counties which may experience large fluctuations in income from year to year due to changes in farm or other income.

OFM/Forecasting 7/89

## Estimates of the Disabled Population Civilian, Noninstitutional Persons, Age 16-64 with a Work Related Disability

Beginning in the early 1970s, federal, state, and local governments established legal provisions to prohibit discrimination on the basis of disability. Laws were also passed to guarantee equal opportunity in employment and government services for people with disabilities. Data on the incidence of disability in the population has become essential to the enforcement and evaluation of these non-discrimination and equal opportunity provisions. On the state and county levels, the only reliable source of information on the number of people with disabilities has been the 1980 census. As a complement to its estimates of population by age, sex, and race, the Office of Financial Management (OFM) has updated 1980 disability data to reflect changes in the size and composition of state and county populations, as well as national trends in the incidence of disability. Table 18 provides these disability estimates.

### Definition of Disability

The 1980 decennial census long-form, asked respondents to indicate the presence of a physical, mental, or other health condition, of six months or more duration, which limited or prevented their capacity to work. Because people under age sixteen and above the age of sixty-four are employed or seeking work, responses to the census work disability question are meaningful only for people in the 16-64 working age population. In practical terms, therefore, the 1980 decennial census, defines disability in terms of self-reported conditions that prevent or limit work for persons 16 to 64 years of age. The OFM estimate of people with disabilities is based on this definition.

### Data and Methodology

The factors most likely to have caused significant change in the incidence of disability since 1980 are: (1) changes in the size and age composition of the population; (2) changes in self-perceptions of disability; and (3) changes in health care and related practices. The method used by OFM to update the 1980 disability data reflects the possible impact of these three factors.

The steps used to derive the 1988 disabled population estimate were as follows:

(1) Disability rates were established for the state and counties, by age and sex, from the 1980 decennial census.

(Note: because state and county disability rates from the 1980 decennial census are based on a five percent sample of the state population, samples of sufficiently large size to support a valid estimate of disability were available for only the state and its ten largest counties. The remaining counties were consolidated into six groups of three to six counties each, to obtain valid estimates of the disabled population. Disability rates for county groups apply to those counties in the aggregate, and not necessarily to each county within the group. However, in the absence of a reliable single county estimate, the group disability rate can be used as the best available estimate for each county within a group.)

(2) Trends in disability rates by age and sex from 1980 through 1988 were examined for the national population from the U.S. Census Bureau's Current Population Survey.

(3) Nominal changes in disability rates by age and sex nationally were examined to determine whether these represented actual changes in the incidence of self-reported disability or whether they were more likely sampling error.

(4) Rates of change from 1980 to 1988 were calculated for those age-sex groups in which an actual change in the disability rate is likely to have occurred.

(5) These rates of change were applied to Washington State and county 1980 disability rates by age and sex to derive 1988 disability rates.

(6) The 1988 disability rates by age and sex were applied to corresponding estimates of the 1988 state and county populations to obtain an estimate of the number of people with work-related disabilities on the state and county levels.

### **Highlights**

Between 1980 and 1988, the number of working-age people in Washington with a work related disability increased from 231,300 to an estimated 249,200, an increase of 17,900, or 7.7 percent. This compares to an overall population increase of 9.7 percent. Because the general population grew faster than the disabled population, the rate of work-related disability in Washington fell from 8.8 percent in 1980 to 8.6 percent in 1988.

### **Changes in Age Composition**

Change in the age composition of the population is the main reason why the disabled population has grown more slowly than the overall population since 1980, resulting in a decline of 0.2 of a percentage point in the incidence of disability. Between 1980 and 1988, as a result of births, deaths, aging, and migration, the largest population increases occurred in the 25-44 year old age group, which normally has a lower than average disability rate. The number of people in the 45-64 year old group, which typically has the highest disability rate, remained about the same between 1980 and 1988. The overall effect of these population shifts was to reduce the statewide disability rate from 8.8 percent to 8.6 percent.

### **Changes Within Age Groups**

There is evidence on the national level that the disability rate of 45-54 year old persons decreased by 1.4 percentage points between 1980 and 1988, compared to virtually no change in the disability rates of other age groups. This decline may be due to changes in the perception of disability by 45-54 year olds, to improvements in health care and related practices, or to both factors.

### **Differences Among the Counties**

The highest disability rates tend to occur in the rural and lumber areas of the state, which lose many young people to urban counties with better employment opportunities. Counties with high proportions of retirees also tend to have higher disability rates.

Better job opportunities in the urban counties, and poorer labor market conditions in rural areas, may also influence the perception of whether a disability limits one's capacity to work. This may contribute to the disparity between rural and urban disability rates. The availability of more and better health care in most urban areas, compared to the rural counties, may also contribute to this difference.

Yakima County had the highest disability rate in 1988 (11.3 percent); followed by Island, San Juan, and Skagit Counties, with a 10.4 percent rate; and Clallam, Mason, Grays Harbor, Jefferson, and Pacific Counties, with a 10.2 percent rate. Benton County (6.6 percent) and King County (7.4 percent) had the lowest disability rates in 1988.

**Notes:**

Disability is the self-reported presence of a physical, mental or other health condition which has lasted six or more months, and which limits or prevents one's capacity to work.

1980 disability figures are based on a five percent sample of Washington State residents from the 1980 Washington State Decennial Census.

1988 disability figures are estimated from the 1980 Washington Decennial Census, national disability trends between 1980 and 1988 from the Current Population Survey, and 1988 Office of Financial Management total civilian, noninstitutional population estimates. (See methodology discussion).

Figures exclude: military personnel; inmates of state and federal prisons; inmates of local jails; residents of juvenile detention centers, homes for the disabled, hospitals for the mentally or chronically ill, nursing homes, and veterans homes.

## State and County Populations by Age: 1989, 1990, 1995, and 2000

The county populations provided in this section represent an update to "Forecasts of the State and County Populations by Year for Selected Age Groups: 1980 - 2000," released September, 1986. County total populations for 1989 result from annual population estimates developed by the Office of Financial Management. Forecast populations for 1990, 1995, and 2000 reflect growth trends that have occurred in each county between 1980 and 1988.

### Data and Methodology

Population figures represent the the total resident population as defined by the federal Bureau of the Census and include military and military dependents. County age detail for both the 1989 population estimate and forecasts for 1990, 1995 and 2000 were derived with an allocation model. There are three sources of data used in this model: 1) the 1980 age distribution for each county from the 1980 census; 2) the estimated (or forecast) total population of each county for 1989, 1990, 1995, and 2000; and 3) the estimated and forecast age distributions for the total population of the state for 1989, 1990, 1995, and 2000.

The allocation model is applied to these data. First, age distributions for the state total population are used to represent changes in the age structure of the populations of counties, assuming that counties change their age structure from 1980 through 2000 in accordance with changes in age structure measured at the state level. Total population estimates and forecasts for counties represent the amount of change in the total population of counties and, thus, are the control totals allocated by age. The procedure iterates to adjust each county's age detail to the county population total. The procedure further iterates to adjust age categories for all counties to state total population age detail. Accumulated total populations that result from these iterative adjustments show only slight deviation from the state and county populations that were used as control totals. The age estimates and forecasts are not rounded while total population estimates are rounded. Unrounded numbers do not imply precise estimates and/or forecasts of age detail.
